

Grayce

Graduate Data Consultant

By
Alexander Thompson

About Me

Hobbies: Gym, Fishing, Hiking, Programming.

Passions: Philosophy, Music, History, Healthy Lifestyle.

Values: Hard work, Morality, Determination, Friendship

Education & Skills

- **University of Westminster**, BSc Economics
- **Programming Languages:** SQL, R and Python
- **Software:** Excel (Advanced), IBM SPSS, Minitab, EViews, Bloomberg Terminal
- **Skills:** Financial/Economic Analysis, EDA, Statistics, Regression Analysis, Machine Learning, NLP, Data Engineering, APIs, Web Apps.
- **Soft Skills:** Teamwork, Collaboration, Problem Solving, Attention to Detail, Data Storytelling

UNIVERSITY OF
WESTMINSTER 卐

My Experiences

- University: Policy Analysis, Regulatory Economics(Ofgem), Strategy Review (Sony), Malware Detection (Google Workspace).
- Independent: EDA, Machine Learning (TikTok, Waze, etc), NLP, Web Scrapping, Web Applications

Requests
http for humans

Google Workspace

ofgem

Why Grayce?

Data-driven
consultancy fits
my career goals

Apply data skills
in real client
environments

Consultancy
suits my
strengths

Values that
align with how I
work

Data Skills

Let's have a look at my data skills in action with some case studies.

We will start by looking at a successful company, including the factors that led to their success and how they adapted and transformed over time.

For this we will be looking at NVIDIA.

NVIDIA

- Founded on April 5, 1993, by Jensen Huang, Chris Malachowsky and Curtis Priem.
- Focused on Graphic Processing Units (GPUs) for video games and workstations applications.
- Adapted GPUs potential to other emerging markets such as AI and Supercomputing.
- They now develop hardware and software for accelerated computing.
- They are the 7th US company to reach \$1 Trillion valuation. ([Yahoo Finance, 2023](#))
- First company to go past \$4 Trillion valuation. ([Forbes, 2024](#))

How they became successful?

- NVIDIA didn't limit their horizons to gaming, they realised and adapted their technology for the future of computing e.g. crypto mining and AI.
- Invested early into AI and Accelerated computing before demand rose, e.g. CUDA.
- Transformed their business model from selling components to full AI infrastructure and services.
- NVIDIA story highlights the value of innovation, thinking ahead and adapting early.
- But there is one more factor ... the AI Boom.

The AI Boom

- The AI Boom in the early 2020's, led to a significant increase in the demand for AI data centres and its hardware.
- AI models need fast GPUs because they process huge calculations in parallel, making training and inference faster and more efficient.
- NVIDIA had already developed Deep GPU Xceleration (DGX) supercomputers in 2016. ([TechCrunch, 2016](#))
- These are used for high-performance AI computing platforms to be used in data centres to train and deploy advanced AI models.
- This demand for AI data centres hardware led to NVIDIA becoming the first company in the world to reach \$5 Trillion valuation.
- As of 2027 Q1 Fiscal Year, NVIDIA recorded a revenue of \$81.6 Billion, with \$75.2 Billion coming from data centre revenue. ([NVIDIA, 2026](#))

NVIDIA Revenue

NVIDIA Currently

- On 1st June 2026, at their GPU Technology Conference (GTC), unveiled their new superchip the RTX Spark. ([Yahoo Finance, 2026](#))
- Marks NVIDIA's move into the PC processor market, expanding beyond GPUs and data centres.
- RTX Spark will power AI PCs from Dell, Lenovo, Asus and more.
- Designed to bring high-performance AI computing into compact devices.
- NVIDIA's share price increased by 6.2% in a day.

NVIDIA Share Price

In response to this, Intel's share price fell by 4.7% in the same day.

Intel Share Price

This brings us onto our next case study about a company that failed to adapt, Intel.

Intel

-
- Founded on 18th July 1968 by Gordon Moore and Robert Noyce.
 - They design and manufacture Central Processing Units (CPUs) as well as chipsets, GPUs and much more.
 - Wintel, the partnership with Microsoft from the 1990s which made them the dominant supplier of CPUs.
 - Intel supplies the microprocessors for most computer systems manufacturers, with 90% of Office PCs using these at one time.
 - One of the developers of the x86 architecture that is found in most PCs and currently leads the market in this.

Intel's Struggle to Adapt

- Intel struggled with manufacturing and execution challenges.
- Risk-averse culture weakened transformation speed. ([Reuters, 2024](#))
- Market share declined as AMD, NVIDIA and Apple gained ground.
- Over-reliance CPUs, while demand shifted towards GPUs, specialised chips and AI Accelerators.
- Slow to invest and adapt to the AI boom and utilise the potential of their technology.

Intel's Performance

- Q1 2026 revenue: \$13.6 Billion with \$5.1 Billion from data centre revenue. ([Intel, 2026](#))
- NVIDIA data centre revenue: \$75.2 Billion, showing the gap in AI Infrastructure.
- Intel's market value remains low, reflecting weaker investor confidence.
- Revenue fallen from 2020-2021 peak, highlighting the cost of slower adaptation.

Intel and NVIDIA

- On the 8th of November 2024, Intel left the Dow Jones Industrial Average and was replaced with NVIDIA. ([Reuters, 2024](#))
- In September 2025, NVIDIA invested \$5 Billion as part of a partnership to co-develop data centres and PC CPUs.
- Enables Intel x86 CPUs to integrate with NVIDIA's AI and data centre platforms.
- NVIDIA agreed to buy Intel shares at \$23.28 per share.
- Recent NVIDIA product announcements highlight growing competition in areas where Intel has traditionally been strong.

NVIDIA vs Intel: Diverging After the AI Boom

- NVIDIA capitalized on the AI Boom through early investment in GPUs and data centre infrastructure.
- Intel struggled to keep pace, with revenue remaining comparatively flat after slower adaption to AI acceleration.
